

1 Case: Hotel website practice assignment ;

In the past, we were active in the travel industry Maykin had a platform for package holidays (Recharted) and building travel websites.

For this practice assignment, we ask you to create a simple hotel website based on a number of wireframes, this can be done in HTML/CSS/JS or in a frontend framework. Our preference is to use React.

For the dataset, you can use (a small subset of) the hotel JSON data that can be found here: <https://github.com/WillGardella/hotels/tree/master/json>

Requirements are:

- A list view of hotels, with working pagination
- A detailed view of a hotel with multiple rooms in it (fictitious, rooms are not in the mentioned dataset)
- Tests to prove that your hotel website is working properly. Be pragmatic in what you test and how you approach it
- Documentation that allows another developer to pick up your project and build on it (again: be pragmatic on how far you go with this, you can assume that the other developer is familiar with the tooling/framework used)

Optional are:

- Add filter options to the list view of hotels (e.g. by 'locality' or 'region')
- A reservation form to make a reservation for the hotel based on an arrival and departure date
- Showing reviews for a hotel
